Summary

Dolores River Dialogue
2005-2008
Primary DRD Science Participants

- Colorado Water Conservation Board
- Montezuma Valley Irrigation Company
- Colorado Division of Wildlife
- The Nature Conservancy
- United States Forest Service
- Bureau of Land Management
- Fort Lewis College
- Northern Arizona University
- Bugs Consulting
“The fundamental process driving the Dolores River Dialogue are complex both politically and scientifically. Several interrelated factors such as flows, gradient, invasive species (flora and fauna) and human impacts, have a bearing on the available options for success within the lower Dolores River system.”
Major topics of discussion

- Geomorphology (Primarily sediment transport).
- Cold Water Fisheries (mainly Rainbow)
- Warm Water Fish
- Riparian Ecology
- Special Specie of Concern
  1. Round Tailed Chub
  2. Flannel Mouth Sucker
  3. Blue Headed Sucker
Issue of special note: Reaches 1-6 are the current area of focus for the DRD.
Upstream of Gateway
Area just below McPhee Dam
Example from the photo point study
03/2005 Reach 7 confluence of San Miguel looking downstream

10/2005 Reach 7 confluence of San Miguel looking downstream

Same group of trees

Fine Sediment after 2005 spill

Looking upstream from Photo 2

Area of Interest
My thanks to the Suckla Family for their support with this study
Lessons learned

- Timing of spill can be difficult.
- Spills < 50K af difficult to plan management options.
- Flushing flows can be negated due to late fall fine sediment loading.
- Individual Reaches have differing opportunities to achieve ecological targets.
Primary Questions 2008

- Temperature and river flow relationships
- Relationship between flows and Cottonwood requirement
- Relationship between flows and nutrients
- Many other questions are being discussed that are intended to look at both native and non-native fish issues, Invasive species (i.e. tamarisk), PFC (proper functioning condition) and overall watershed health
## Current (as of 10/8/08) Research or Monitoring Efforts on the Dolores River

Based on information from 10/8/08 DRD Science Coordination Meeting

<td>A. Coble (NAU)</td>
<td>Has regeneration occurred for major native tree species on lower Dolores and what flow events are associated with that regeneration?</td>
</tr>
<tr>
<td></td>
<td>J. Siscoe (MVIC)</td>
<td>Is there a link between riparian habitat and aquatic habitat, fish populations and/or water quality?</td>
</tr>
</tbody>
</table>
Warm Water Fish

| J. White (CDOW) | What is the status of 3 species of concern (flannelmouth, bluehead sucker, roundtail chub)? |
| D. Kowalski (CDOW) | What is the status of 3 species of concern (flannelmouth, bluehead sucker, roundtail chub)? |

and Cold Water Fish

| C. Anderson (BUGS) | What is the WQ and what is the status of the habitat? What tributaries [perennial] are the most likely to be impacting the WQ on the Dolores? |

Other Related to Dolores River

| S. Jensen (USFS) | Which sub-watersheds of Disappointment Creek are contributing the most salinity? |
